# Acute coronary syndrome

O Gach<sup>1</sup>, Husseini Z El<sup>2</sup>, P Lancellotti<sup>3</sup>

## Abstract

Acute coronary syndromes represent a major cause of mortality in our country. There is a very wide spectrum of clinical presentation since the actual classification of acute coronary syndromes is based on electrocardiographic presentation, that is to say based on absence or presence of ST segment elevation. When dealing with an acute chest pain, once the probability of acute coronary syndrome is established, the emergency care must follow the scientific guidelines. One of the critical steps is represented by the evaluation of ischaemic and hemorrhagic risk in order to tailor optimally antithrombotic and anticoagulation therapies and revascularization timing. This article summarizes the main points of the emergency care from the diagnosis to risk stratification

# Acute Renal Failure and Its Complications, Indications for Emergent Dialysis, and Dialysis Modalities

Luba Muaddi<sup>1</sup>, Chelsea Ledgerwood, Robyn Sheridan, Tiffany Dumont, Khaled Nashar

## Abstract

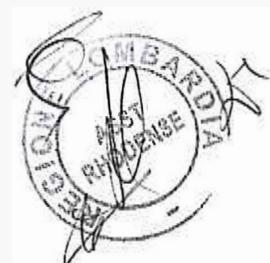

Acute kidney injury or acute renal failure is commonly observed in the critically ill patient with hemodynamic compromise. Dialysis is frequently used in the intensive care units as part of the critical care management of metabolic derangements fluid status and electrolyte issues. It is imperative that the bedside critical care nurse is able to identify acute kidney injury and is familiar with the modalities used to manage the metabolic consequences of renal failure, particularly important as the bedside nurse is operating the continuous renal replacement machine at the bedside.

# Effective communication with people who have dementia

Dev Jootun<sup>1</sup>, Gerry McGhee

## Abstract

This article explores the skills needed for effective communication with people who have dementia. It describes the factors that influence the communication process and the effect this may have on the nurse-patient therapeutic relationship. Cognitive impairment in people with dementia may limit their ability to communicate effectively. This may, in turn, affect the nurse's ability to identify patients' needs. Communication is central to providing good dementia care. The article examines some of the challenges nurses may face when caring for this patient group and suggests some strategies to overcome any barriers, enhance quality of care and improve patient outcomes.

# Triage Nurse-Ordered Testing in the Emergency Department Setting: A Review of the Literature for the Clinician

Michael Gottlieb<sup>1</sup>, David A Farcy<sup>2</sup>, Lisa A Moreno<sup>3</sup>, Gary M Vilke<sup>4</sup>, Jesse A Guittard<sup>1</sup>

## Abstract

In an effort to decrease length of stay (LOS) and reduce overcrowding, many emergency departments (ED) have implemented triage nurse-ordered testing.

The initial search yielded a total of 982 potentially relevant studies; 13 articles were ultimately selected for inclusion. Of these, 10 studies assessed ED LOS, with one study assessing time to diagnosis. The three remaining studies compared triage nurse-ordered testing with physician testing in the ED setting.

Triage nurses have reasonably similar accuracy as physicians in ordering limb x-ray studies and moderate accuracy for laboratory testing. However, we did not identify a clinically meaningful decrease in ED LOS from the use of nursing triage orders.
