Evaluation of nurse's performance in telemedicine

Claudinalle Farias Queiroz de Souza¹, Dulcineide Gonçalo de Oliveira², Alef Diogo da Silva Santana¹, Letícia Moura Mulatinho¹, Mirian Domingos Cardoso¹, Emanuela Batista Ferreira E Pereira¹, Jael Maria de Aquino¹

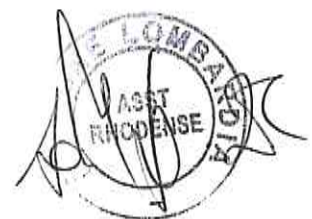

Abstract

Describe the nurse's role in the Telemedicine Program in Cardiology implanted in Pernambuco, Brazil.

The sample consisted of 19 nurses, mostly female (80%), with a mean age of 30 years old. Two central ideas were constructed: nurses' knowledge about the Telemedicine Program in Cardiology; and actions developed by nurses. Also, a flow of the program's assistance was built.

The nurse in Telecardiology performs functions of assistance and continuing education of monitoring and training for patients

Prone Position in Acute Respiratory Distress Syndrome Patients: A Retrospective Analysis of Complications

Alberto Lucchini¹, Stefano Bambi, Elisa Mattiussi, Stefano Elli, Laura Villa, Herman Bondi, Roberto Rona, Roberto Fumagalli, Giuseppe Foti

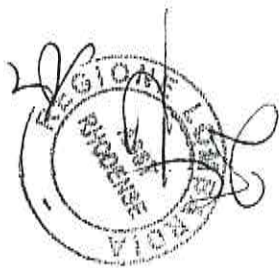

Abstract

Early application of prolonged prone positioning has been shown to improve patient survival in moderate to severe adult respiratory distress syndrome (ARDS) patients. Prone position is a key component of lung protective mechanical ventilation in association with low tidal volume and neuromuscular blocking agents in patients with severe ARDS. Pressure sores are the major prone position complication. The rate of complication is lowering with the increase in center expertise.
